Great Technology - Compact and Quiet

PremiumLine

BÖWE
Textile Cleaning

Your Building Says: It Should be Compact!

Your Conscience Says: It Should be Environmentally Friendly!

Your Demands Say: It Should be Reliable!

BÖWE'S PremiumLine
is the answer for you

Easy Installation

When developing the P12, P15 and P18 we primarily had one issue in mind: the limited space in drycleaning shops. Both machines are available Slimline and Crossline therefore, these machines are available in the correct configuration for your shop. Just what you need for your shop a machine that will fit through your front door with the measurement now below 2.000 mm height. With our P2M-kit, a BÖWE Perc machine can be converted to a BÖWE Multisolvent machine. After the conversion you can use solvents like hydrocarbon, silicone solvents, GreenEarth®, Rynex and Solvon K4.

Slimline -
The still is mounted
behind the machine

Crossline -
Here, the still stands
beside the machine

Classic elegant design
for your shop

Compact - even with Additional Equipment

Special requirements and regulations can often only be fulfilled with special equipment like an Emission Free Still Rake Out System or an optional adsorption unit SLIMSORBA. Even with these additional features the machines remain very compact.

Ready for Various Kinds of Use

The machines are available as a 3-tank-version and also with an optional second Eco-filter and an additional carbon filter. Thus, you are extremely flexible, especially when cleaning different types of garments.

Take care of yourself, your employees and also the environment - with the new P12, P15 and P18 you will easily comply with the strict requirements of environmental regulations.

Easy Maintenance

Only a machine that is well maintained is environmentally friendly: easy access openings on the back plate of the machine allow for proper inspection and maintenance. Further, the back plate of BÖWE machines is covered with a unique special coating, so that there will be hardly any lint clusters.

The new water separator is self-cleaning and offers utmost comfort with maintenance by fully automatic maintenance programs. Thus manual work is nearly not required.

Still rake out is performed automatically and emission free, without the need to open the still.

SLIMSORBA PL

As an option to the standard equipment the fully integrated adsorption unit SLIMSORBA produces garments free of odor and an exceptionally low residual concentration of solvent. If needed, desorption can be started by fully automatic maintenance programs.

The SLIMSORBA surpasses the strictest environmental regulations

Eco-Filter and Safety Trough

The efficient Eco-filter works with the proven multiple disc extraction technology. The filter system is monitored via the computer and pressure sensors and can be maintained easily and fully automatically. The robust safety trough is an impermeable barrier protecting the soil and ground water from solvent.

Self-Cleaning Solvent Tanks

A new tank geometry offers especially sloped tank bottoms and the solvent exhaustion at the lowest point. Together with the modern processing technique for smooth surfaces, the 3 tanks practically do not allow for any deposit anymore.

No deposit-Self-Cleaning

Power Drying System

Results of scientific calculations and air flow simulations have led to the newly designed recovery section. The concept is proven for years already with the BÖWE MultiSolvent®, machines.

More power in the airflow - less time for drying

In cooperation with the dynamic cage perforation the new recovery section increases the capacity of the PDS even further. Thus, the fast drying is supplemented by the attributes quiet and low-maintenance.

Variable Speed Drive and EBS®

The "compact" machines by BÖWE are equipped with variable speed drive and EBS® (Electronic Balancing System). Unbalanced loads are electronically adjusted during extraction, so partial loads maintain excellent cleaning and efficient extraction. The variable speed drive with its speed control provides for smooth cleaning, that can be individually adjusted for all types of garments.

High-Capacity Control ConfoTronic PL

The ConfoTronic PL offers a variety of possibilities for individual adjustment to various tasks and guarantees a safe, efficient, and variable operation of the machine.

The control can easily be updated by reading from a standard MMC or SD card.

BÖWE Direct Connect

The P12, P15 and P18 are ready for the BÖWE Direct Connect. With the BÖWE Direct Connect Software there is the possibility to work with the machine from a PC. You can retrieve daily, maintenance and operational reports locally or off-site and analyze them statistically. The system offers you and your service partner the cost effective and time saving remote diagnosis via telephone connection. Cleaning programs can easily be copied, edited, saved and loaded to PC or machine. We call this BÖWE Machine Management.

Only one maintenance opening for Lint filter and button trap: The round design eliminates edges for lint to gather

The new, self-cleaning BÖWE water separator

BÖWE Direct Connect - Remote diagnosis is already integrated
